Processing authorisation and rate-of-yield schedule

Authorisation NL-PRC-063 | 2025 original grant; Annex RY-2 effective 1 September 2026 | exported from customs portal 18 October 2027

Main inward-processing authorisation

North Sea Metals B.V. may place imported CN 7208 39 00 hot-rolled flat steel under inward processing for conversion into specified vehicle components CN 8708 29 90. The accounts are NL-IP-061, NL-IP-088 and NL-IP-112, supervised at Rotterdam. The holder must maintain material identities, production records, a bill of discharge and a reconciliation of inputs, finished output and residual products.

Field	Authorisation text
Input identification	Consignment reference, work order and finished-product sequence; the operator must retain evidence identifying the original material that resulted in the processed products
Planning rate of yield	90% for ordinary series, to be used for forecasts, ordinary production and the annual planning report subject to Annex RY-2
Alternative method	Where documented material-specific losses differ from the planning rate, the holder is to provide actual-production figures supported by the relevant tool runs and quality records under Annex RY-2
Goods and output	CN 7208 39 00 input, CN 8708 29 90 processed components

Annex RY-2 — pilot, start-up and abnormal scrap

The supervising office received a method request and endorsed the use of documented actual production data for material-specific C-series test runs from 1 September 2026, in addition to the 90% planning yield. The annex refers to the accompanying approved technical method: weigh input at the production station; identify the output and reject stream; reconcile the total to the annual bill of discharge. It does not itself approve each individual claimed input tonnage.

Technical record	Content in filed schedule
Ordinary C-series	500 t total original input, 450 t final output, 50 t process residue; annual planning report calculated at 90% yield
C-01 production	Separate start-up cycle and tooling change recorded, with additional reject flow; the relation between the finished goods and initial feed must be substantiated
Production evidence	Referenced ticket family PT-711a-c, weigh scales RS-711-1 to RS-711-S and scrap disposition SCR-11
Customs records	The bill of discharge BOD-112 was received in January 2027; the extract does not show a substantive final assessment of the production-method entries

The authorisation contains no permission to use Union goods in substitution for the imported Turkish hot-rolled coil. Nothing in the procedure extract disapplies the Union Customs Code, customs trade-defence measures or the distinct reporting obligation under Article 6(3) of Regulation (EU) 2023/956.
