Manufacturing supply and technology instruments

Extracts from executed agreements and retained schedules

1 | Master Manufacturing Supply Agreement

PARTIES	Asterion Motion Systems Inc. (US buyer) / Asterion Praezision GmbH (DE) / Asterion Motion Japan KK (JP)
SIGNED	12 December 2024, counterparts complete 18 December 2024
TERM	1 January 2025 through 31 December 2027, subject to schedule revisions
COMMERCIAL CONDITION	EXW relevant manufacturing plant; USD invoicing; transfer of ownership at factory dispatch

Clause 4.1 (Prices): Initial purchase orders use the latest approved intercompany catalogue. A final price may be determined under the pricing circular and a valid item-specific schedule incorporated into the purchase order; any differential is settled through a documented invoice, debit note or credit note. Each party shall maintain the underlying records used to establish the price. The parties may agree commercial revisions in writing, including by authorised electronic approval. The accounting effective-date field does not replace agreement of a revision.

Clause 4.4 (Programme commitments): Product-specific launch costs, market-support services and other group charges may be settled separately. The Shared Services team may process programme support, service charges and price-related balances through the central treasury netting channel and will retain their original counterparty references.

Clause 7.3 (CN commercial conditions): The CN08 programme includes a US market-introduction plan and an agreed requirement to provide distributor training and first-year warranty support. Supplier and buyer shall periodically review the costs and the competitive position of this programme, with any price or support revision requiring documented approval by both sides.

Clause 9.2 (OP programme continuity): OP03 devices are produced using embedded controller technology licensed through Asterion IP Pte Ltd. The Japanese plant may suspend acceptance of new OP03 orders if it lacks evidence that the buyer's embedded-technology sublicence is current. Production and supply terms may be continued under another brand for non-OP drive products without a North America marketing-mark licence.

2 | Press-tooling record, AX14

Asterion US acquired dedicated press dies on 21 November 2024 at a cost of $180,000 and paid $12,000 for shipment and installation at the German plant. Title remains with Asterion US. The dies entered production in January 2025 and are used for AX14 shipments to the United States as well as other output of the same series. A signed technical projection, dated 9 January 2025, expects 8,000 manufactured units over the usable programme life. The freight and purchase charges together are recorded on asset card AMT-774. The broker's early entry profile was entered before the asset card was fully updated.

3 | OP03 engineering statements

Sora Design Lab of Osaka invoiced Asterion US $84,000 on 18 December 2024 for the optical positioning and motion-control geometry necessary to manufacture OP03 drive assemblies in Japan. The design files were delivered to the Japanese manufacturer in January 2025 under a perpetual project-use licence. The programme production estimate, endorsed before the first shipment, is 4,200 units.

Separate US personnel in Boston performed $65,000 of local system-integration work in 2025, documented on cost centre RND-OP-91. Their work concerned downstream industrial installation and supervisory control after importation. The Japanese plant ledger refers to other in-house manufacturing-development and production-overhead charges, separate from the Osaka contractor invoice.

Royalty and market-rights agreements

Controlled licence excerpts | Asterion IP Pte Ltd, Singapore

4 | Embedded motion-control licence

CONTRACT	ECL-2024-OP / executed 20 December 2024
LICENSEE	Asterion Motion Systems Inc., United States
LICENSOR	Asterion IP Pte Ltd, Singapore
PRODUCT SCHEDULE	OP03 devices with embedded drive software; not AX14 or CN08

Section 2: The licensor grants the US distributor access to embedded motion-control firmware in OP03 and authorises the use of the firmware in devices supplied by the Japanese manufacturing affiliate. The Japanese manufacturer receives its production authorisation from the licensor, subject to confirmation that the US buyer remains in good standing under this embedded-technology sublicence.

Section 5: The licensee owes a running amount equal to 2.4 per cent of net third-party US resale revenue from OP03 units using the controlled embedded technology. Net revenue excludes approved customer rebates and returns. The amount is invoiced annually on commercial sales data. Neither the licensor nor the buyer presently records this royalty as a separate line on the factory purchase invoice.

Section 8: The licensor may notify the Japanese plant that the licensee is no longer in good standing. The plant may withhold deliveries of OP03 products until the relevant production and distribution rights are restored. Nothing herein changes the parties' obligations as regards other drive series or independently licensable distribution marks.

5 | North America brand and marketing agreement

CONTRACT	NAA-2025-14 / signed 7 January 2025
SCOPE	Use of the Asterion mark, field-marketing programme and regional network services
COVERED SALES	AX14, CN08 and OP03 third-party North American revenues

Sections 3-4: Asterion US pays 1.5 per cent of net third-party revenue from the covered business for local use of group marks and access to central network tools. The charge is not described in the manufacturing supply agreement as part of factory unit pricing. White-label resale of other industrial drives remains contractually possible, subject to customers' acceptance of commercial alternatives. A separate $42,000 annual network participation charge was approved for 2025 at the annual commercial committee meeting.

Section 9: These marketing rights support use and promotion of the mark in the United States. The contracting parties have not entered into an agreement that Asterion US must carry every product under the Asterion mark as a condition of obtaining the product from its manufacturer.
